Education

New York University — M.S. in Management and Analytics (STEM)

Sep 2025 – Jan 2027 (expected)

GPA 3.92 / 4.00 | Coursework: Tech Project Management, Data-Driven Decision Making, Databases

Xi'an Conservatory of Music — B.A. in Music Performance

Sep 2021 – Jul 2025

Honors: Outstanding Graduate, National Encouragement Scholarship

Product Experience

Lingxian (lingxian.app) Founder & sole builder, guqin notation-editing SaaS (invite-only beta) Feb 2026 – Present

Guqin (Chinese zither) players shared scores by hand-copying and phone photos. Defined, built (AI coding tools, Next.js + PostgreSQL) and launched an editor from scratch: in 7 months, 94 registered users, 160 scores, 144 PDF exports, 20.7% week-2 retention (n=82).

- **User research to AI roadmap:** Coded 119 sign-up applications into 10 need categories; 34 asked for auto-converting numbered notation (jianpu) into guqin notation. Framed it as candidate generation + ranking: rules generate valid options, a model ranks them, the product collects preference data.
- **Auto-transcription:** Shipped an editor where a rule engine enumerates valid techniques and beam search picks the best-scoring sequence, with a candidate panel for human override; an edit-feedback pipeline has logged ~3,800 edit events as future ranking-model training data.
- **Activation funnel:** Measured each step separately (sign-up → create → save → usable score → export); the largest loss was creators who never produced a usable score (53%). Matched it to "input is too hard" feedback and shipped keyboard-style and batch input; now 35% (no control group).
- **Invite conversion:** Only 19 of 35 approved applicants (54%) redeemed invites; traced it to 2-day token expiry and spam filtering, then shipped longer expiry and one-click resend.
- **Monetization:** Designed a four-tier plan structure and launched two tiers with no paid billing yet (pending a Chinese business entity); validated demand with gifted plans: 2 sponsorships and 5 purchase-intent sign-ups.

AI Editing Assistant Lingxian sub-project — AI product design & evaluation

Jul 2026 – Present

- **Agent design:** Turned an answer-only chatbot into an in-editor natural-language agent: the LLM (Qwen) only parses intent and writes replies, deterministic tools handle all calculation and edits, behind a check → preview → confirm → execute → undo state machine with stale-snapshot detection.
- **Evaluation & metrics:** Built a 74-case Chinese intent eval set (ambiguous, colloquial and high-risk negative cases) and iterated prompts v1.0 → v1.4 by error type, reaching 96% intent accuracy, 100% valid JSON and zero high-risk false triggers; 38 live interactions from 13 users all succeeded, but only ~13% of users tried it, so defined adoption / undo / trigger-rate metrics and planned moving the entry point into the toolbar.

Work Experience

Luoyang Shangxian Technology Co., Ltd. — Data Analyst Intern Luoyang, China

Jun 2025 – Aug 2025

- Cleaned operations data and user behavior logs with SQL + Python to find conversion drop-offs; standardized metric definitions across teams and replaced manual pulls with automated Tableau + Excel reports.

Projects

Meteor Madness — NASA Space Apps Challenge 2025 Team hackathon project

2025

- Team-built web app simulating asteroid-impact effects (crater, tsunami, blast radius) and population exposure from NASA NEO / Fireball / EONET APIs; Three.js 3D globe, Java REST backend.

Skills

- **Product & AI:** user research, prioritization, PRDs, funnel and event-tracking design, agent workflow design, prompt iteration, evals
- **Data & tech:** Python, SQL, Pandas, Tableau; Next.js, TypeScript, PostgreSQL; AI-assisted development | Mandarin (native), English (fluent)
